Nexthink Infinity platform - Application experience

Digital employee experience (end to end product design)

Challenge:

To newly position and redesign the Application experience overview page in order to display the information in a more manageable way compared to the current version which was overwhelming for the user.

Process:

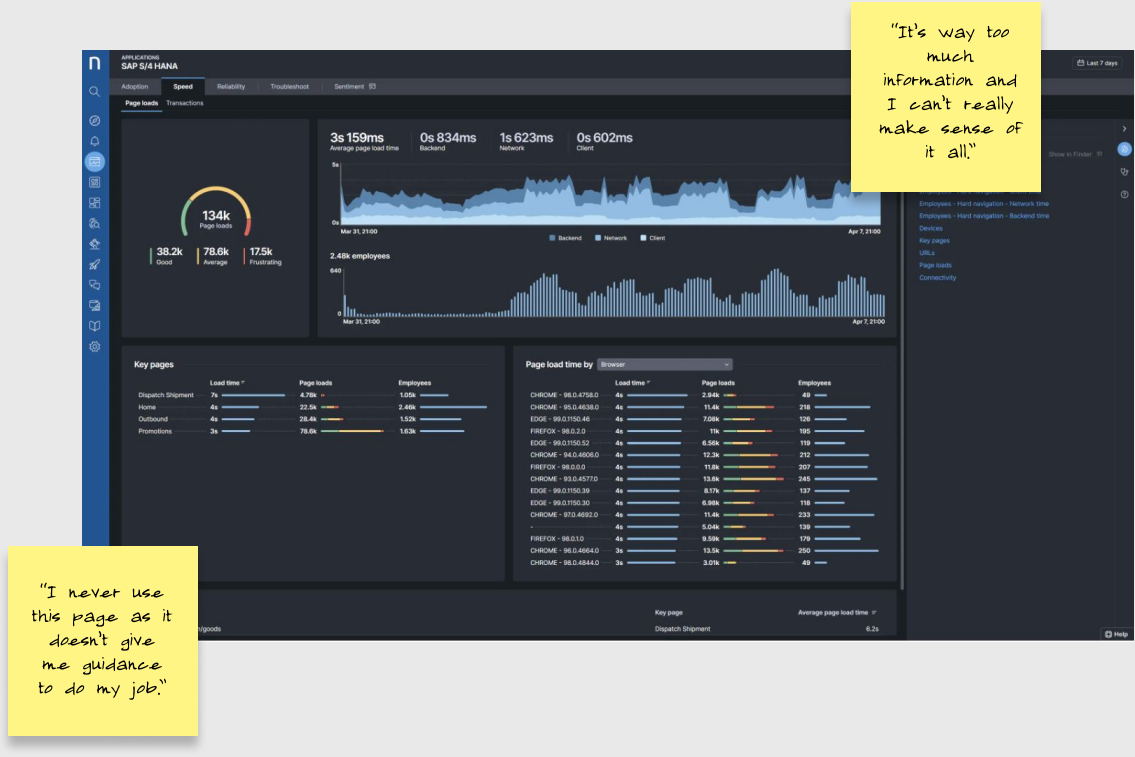

User research informed iterative wireframes and prototypes, focusing on clear information hierarchy and actionable insights as well as offering a more sexy entry point to Nexthink infinity to help sell the product.

Outcome:

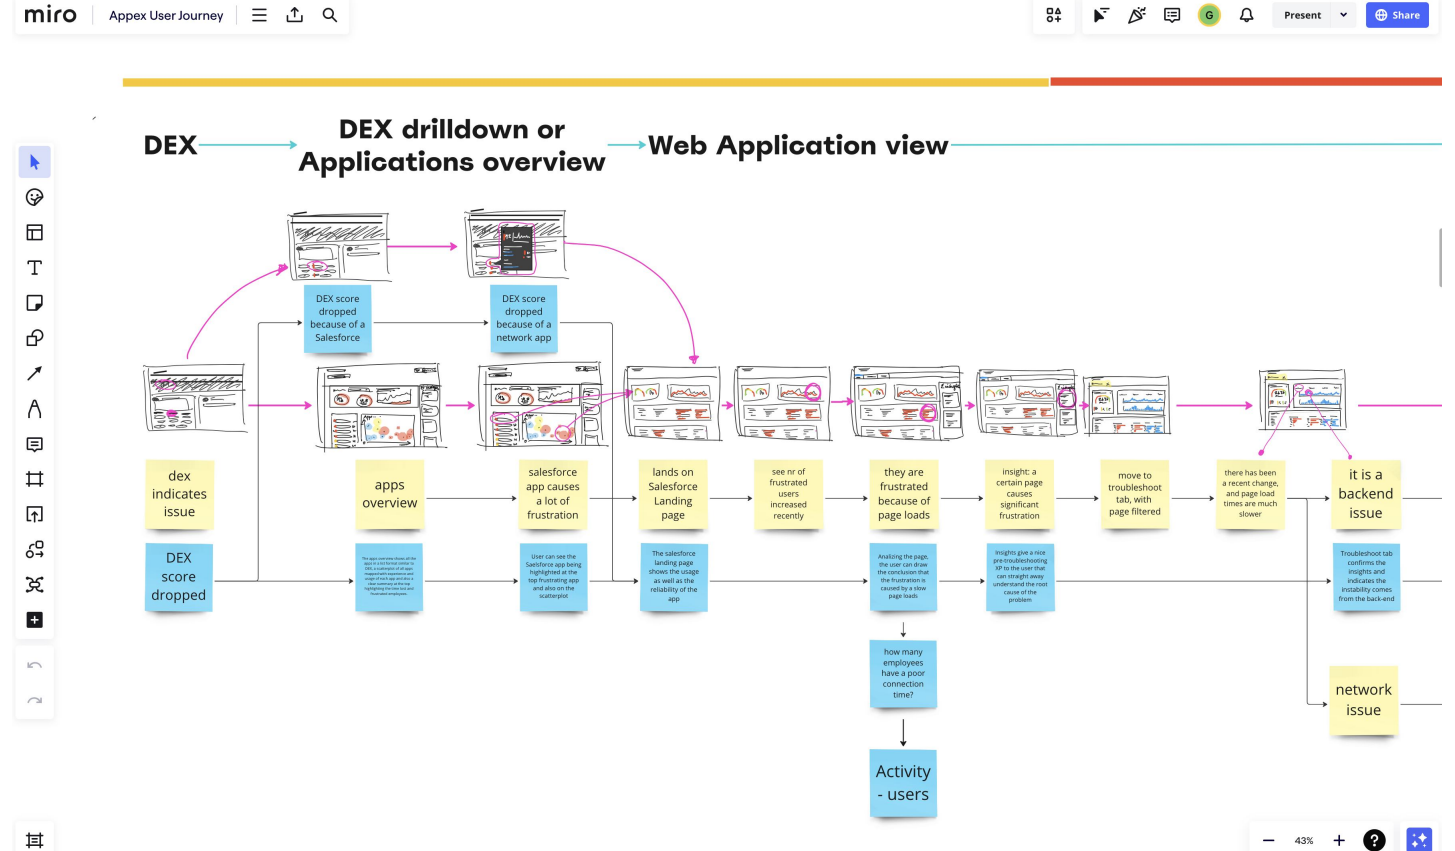

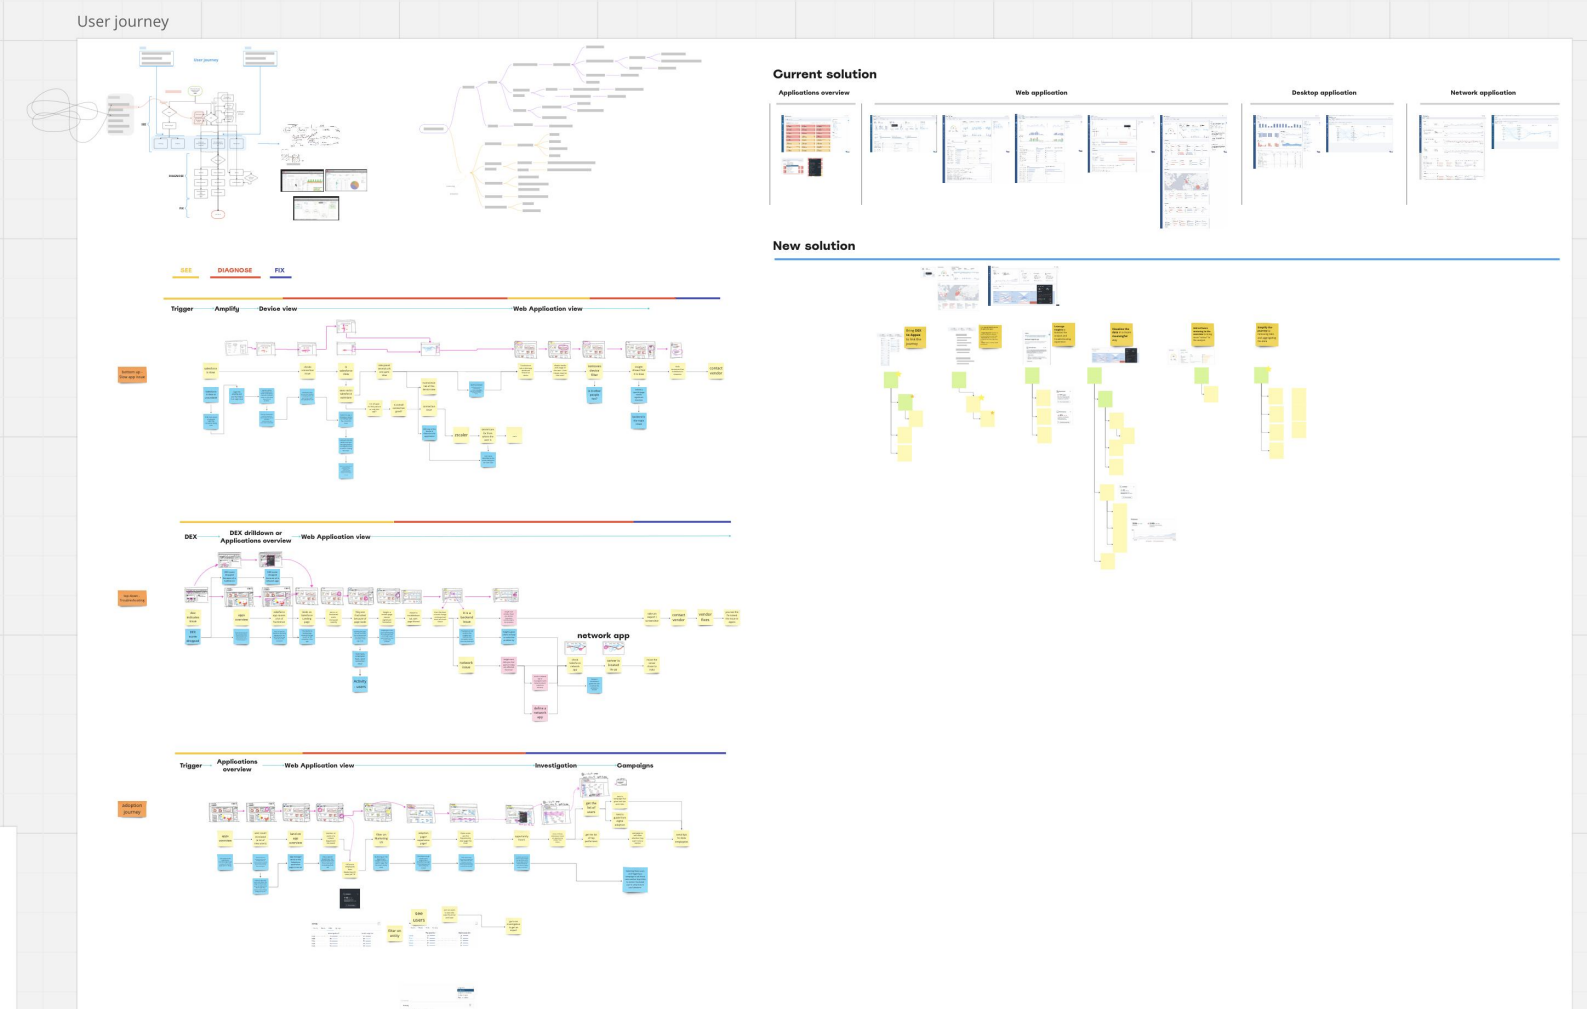

The final improved interface was presented on stage during Nexthink Experience 24 event in Boston and London to attract new clients.

The current design of the Application Experience page presents all the information of the app spread out over 6 sub-tabs without having a summary page to highlight the key decisions to make about this faulty app. This approach **has left customers feeling overwhelmed, as it lacks clear insights and actionable steps** tailored to address specific issues within the application.

User journey definition after multiple interviews with customers and the product manager

Final mock-up iteration highlighting key insights and data-informed decisions/actions to take
