

Mobile application

BACK to all case studies

Nexthink Amplify - Mobile application

Digital employee experience (end to end product design)

Challenge:

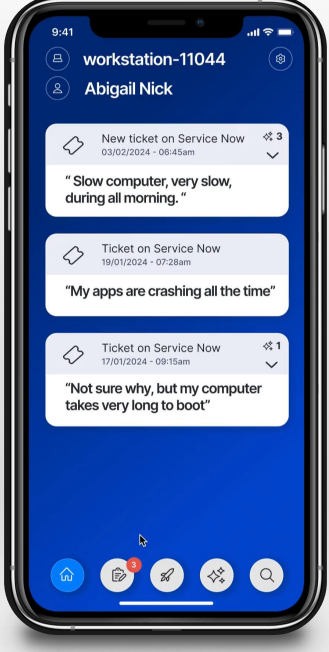

Developing a mobile version of the Chrome extension with AI involved adapting the interface for small screens while integrating AI to provide real-time insights for L1 support. The goal was to ensure the mobile interface was both functional and intuitive.

Process:

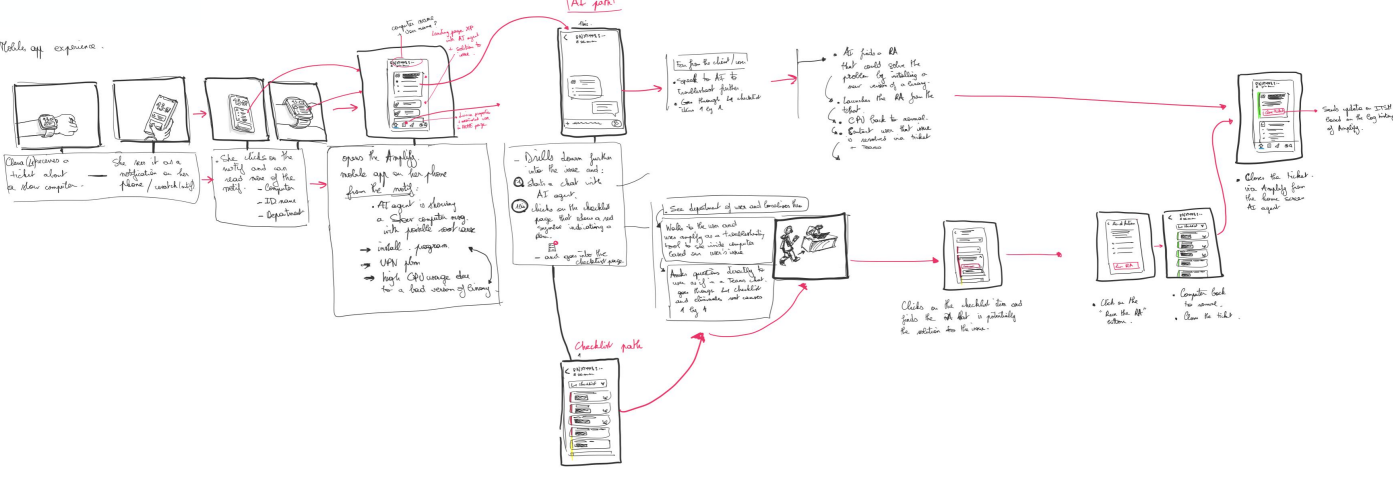

We analyzed mobile usage and user feedback to design a streamlined, touch-friendly interface. AI insights were seamlessly integrated into the workflow. Prototypes were tested to optimize interactions and ensure actionable AI recommendations.

Outcome:

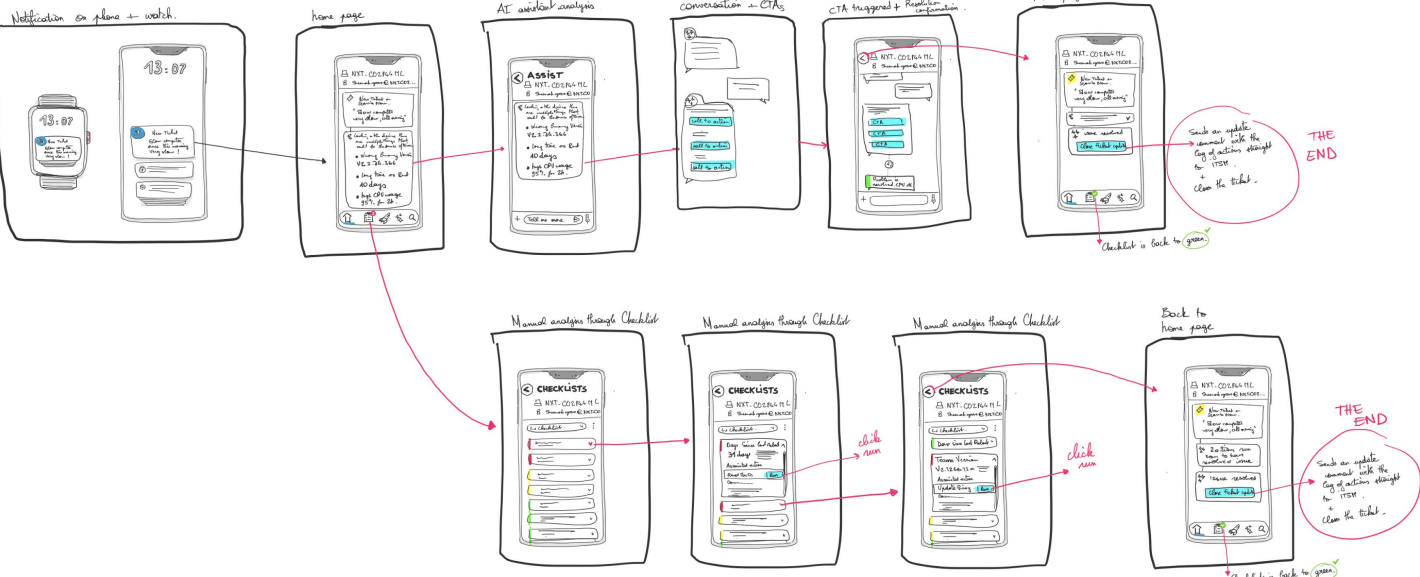

The mobile extension with AI enhanced L1 support efficiency, offering real-time diagnostics and improving resolution speed.

Sketches of the initial user flow to understand the needs of an L1 on a mobile phone compared to a chrome extension

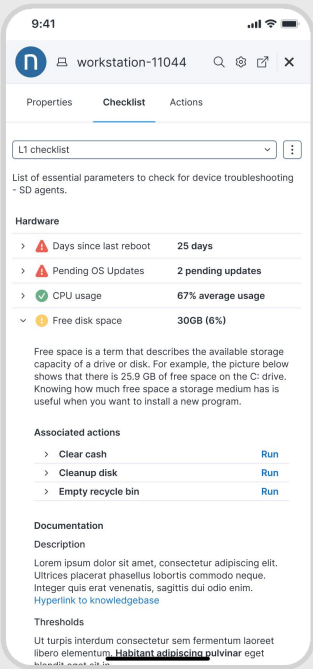

High fidelity sketches / wireframes to understand how the UI could look like

Road map designed on 3 different phases based on the current solution in order to reach the mobile application vision

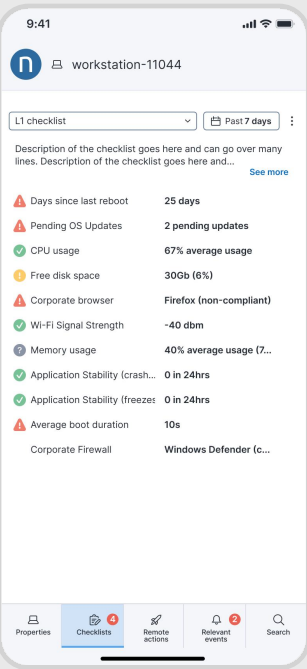

Phase 1

frame of the current chrome extension

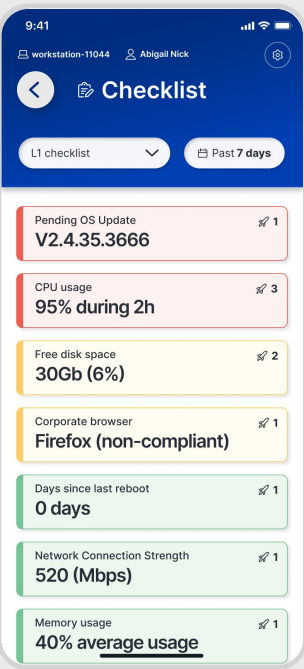

Phase 2

Native mobile app with iframe of the current chrome extension

Phase 3

Custom native mobile application

High fidelity prototype of the final native mobile application
