

AI driven interface

◀ BACK to all case studies

evr. IT Security vision

(Conceptual product design)

Challenge:

Open Systems approached Signal Noise to reimagine the future of IT and network security. The brief from Open Systems was to design a 'concept car'.

Process:

Following a client workshop we developed many iterative solutions to shape the future of their IT security vision. User journey informed and complex data visualisations were designed to finally deliver an animated video of the AI driven interface.

Outcome:

We built a 3 mn animated video of what the future of IT security could look like and was presented in front of more than 100 key stakeholders during one for the flagship event of Open System. An acquisition was made shortly after this event.

Full day **workshop** with key stakeholders

Outcomes

"Make the IoT of security"

"Rebuild the internet"

"Become the iPhone and Swiss Army Knife of IT and network security"

"Eradicate cybercrime"

Key themes

- Deliver peace of mind
- Be proactive
- Be invisible to the customer
- Beautiful + simple
- Deliver the right information at the right time
- Trust building
- Deliver the right information at the right time
- Positive communication
- Reassurance
- Deliver context
- Always on

concept

The next step was to break the project down into one-week sprints with the first sprint focusing on crafting a proposition that would become the basis for all design exploration.

inspiration

Zika virus

User centric visualisation

Oscillation

Rationalise the data that shapes the ring

System (ring)

The Ring represents the system, all the services you have in order to run the IT and Security.

Emotional response (oscillation)

The more unsettled the system the more oscillations bringing an emotional response to the user.

Affect on people (colour)

As the system gets more unstable, it leaves a negative effect on the system.

Explorations

Having gone through the detail and showing the additional thinking behind evr., Signal Noise and Open Systems agreed on a way to move forward and arrived at the following proposition, system and visual language.

The proposition

evr. will visualise issues with your system so you can react to them quickly and effectively: whether it's a technical issue or your system is being compromised internally.

When the system is stable, evr. will be calm and flat.

If an issue becomes more severe the system will become 'unsettled': The shape will reduce in weight, the magnitude of the oscillation will increase and the colour will change to alert you so you can take action.

The end goal of evr. is to identify the overall affect on the people within your organisation and the ability for them to operate on a daily basis.

It's not only important to know who and how many people are affected but also what the range of the causes are and how they relate to each other.
